#### **Funding information**

This study was inspired by project results from an Ecology of Infectious Disease field course funded by a United States National Science Foundation (NSF) CAREER Award to VOE (IOS-1101836). Financial support for this project came from the University of Georgia and NSF Long-Term Research in Environmental Biology Grants 12-56004 and 19-31224. This study was also supported by a postdoctoral fellowship that was awarded to DPT through *icipe* from the UK's Foreign, Commonwealth & Development Office (FCDO) and the Swedish International Development Cooperation Agency (Sida). We also acknowledge financial support from the Swiss Agency for Development and Cooperation (SDC), Federal Democratic Republic of Ethiopia and the Government of the Republic of Kenya. The views expressed in this manuscript do not reflect the official opinion of the donors.

ple effects of biodiversity loss on vectors can lead to counterintuitive outcomes for human disease risk.

#### **KEYWORDS**

arbovirus, biodiversity, mosquito-borne disease, vector, vectorial capacity
